The creation of this tool was possible thanks to a grant from the ISEAL Innovations Fund, which is supported by:

- Schweizerische Eidgenossenschaft
- Confédération suisse
- Confederazione Svizzera
- Confederazione svizzera
- Swiss Confederation
- Federal Department of Economic Affairs, Education and Research (EAER)
- State Secretariat for Economic Affairs (SECO)
**Directing Capital Towards SDG-aligned Infrastructure**

There is a critical need to build resilient and sustainable infrastructure and meet the Sustainable Development Goals (SDG). Unfortunately, investors often find it difficult and time-consuming to identify and invest in SDG-aligned infrastructure projects. The Infrastructure Sustainability Intelligence Tool (ISIT) helps investors to efficiently access high-quality projects, reducing global risks and capturing sustainable returns.

The prototype will undergo further refinement and its geographical scope expanded into new regions. A future iteration of ISIT will be integrated into a digital platform dedicated to project developers and investors focused on future proof infrastructure.

**What Can ISIT Do for You?**

ISIT can be used to quickly identify signals of sustainability and resilience in infrastructure for a large number of projects.

- **For investors**, ISIT supports identification of infrastructure projects potentially suitable for investment, whilst minimizing key risks such as the impact of climate change on the project, or the project’s impact on the climate and ecosystems.
- **For project developers**, ISIT improves visibility of good quality projects to potential investors, incentivizing developers to improve the sustainability and resilience of their projects.
- **For civil society and public sector actors**, it highlights the impacts of planned infrastructure projects on people and planet.

**Assessment Methodology**

Information on infrastructure projects is sourced using data scraping from a public database and processed using machine learning, following the steps below:

- Project-related documents, such as Environmental Impact Assessments, are sourced online and downloaded.
- The disclosed project location is pinpointed on a map.
- Natural Language Processing searches for previously defined parameters in the downloaded documents. In the prototype version, there are 3 parameters: CO2 Emissions, Water Use, and Air Quality.
- A geospatial analysis allows to identify sustainability risks linked to three other parameters: Nearest Protected Area, Sea Level Rise, and Land Use.
- Based on a multi-criteria decision analysis, the project is then given a flag: **insufficient data**, **no sustainability risks detected**, **moderate sustainability risks detected**, or **potentially severe sustainability risks detected**.

**Sample Results Page**

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Document Name</th>
<th>Selected Value</th>
<th>Risk Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sea Level Rise</td>
<td>Year 2050 - No data</td>
<td>Insufficient data</td>
<td></td>
</tr>
<tr>
<td>Nearest Protected Area</td>
<td>Keoladeo National Park - 598.57 km</td>
<td>No sustainability risks detected</td>
<td></td>
</tr>
<tr>
<td>Land Use</td>
<td>Scrub/Deciduous forest - 52.56%, Double/triple - 25.71%, Deciduous Forest - 10.71%</td>
<td>Potentially severe sustainability risks detected</td>
<td></td>
</tr>
<tr>
<td>Air Quality</td>
<td>no-data</td>
<td>Insufficient data</td>
<td></td>
</tr>
<tr>
<td>Water Use</td>
<td>no-data</td>
<td>Insufficient data</td>
<td></td>
</tr>
<tr>
<td>CO2 Emission</td>
<td>no-data</td>
<td>Insufficient data</td>
<td></td>
</tr>
